tracking malicious code with windbg Posted by ictsecurity0 - 14 Feb 2011 - 09:11	
Dear all,	
Sorry if this is dummy question. Just have the idea that, i succe through vmware guest windows xp. Im planning to use windbg activities. my idea is:	
windbg (Host)> vmware (guest windows xp running malwa	re)
my question is: 1. possible if we set the break point of malware.exe in guest w 2. possible using 'wt' to trace what malware.exe doing?	indows xp? using which command?
thanks, from ictsecurity0

Hi,	

Once you have the kernel debug session established you can use ntsd -d to debug the malware via the connection. You can also use breakin to break into the user mode code.
